Lightlab

Measurements of optical components and optical systems are essential whenever a project starts, is in process or ends.

opsira measures the necessary optical values in several light measurement laboratories and provides significant measurement data and test reports.

From simple measurements of a surface reflection through complex scattering light distributions to far-field luminous intensity distributions – data are delivered shortly enabling customers to go on with their projects or include the data into sales information.

Measurement examples carried out in the opsira lightlabs are listed here: www.opsira.com/lightlab
